Data Notes:

- Data provided by CDC Lead Poisoning Prevention Program and state and local Childhood Lead Poisoning Prevention Programs. Compiled by the Department of Health and Senior Services' Bureau of Environmental Epidemiology
- Measures should not be compared across states. Childhood blood lead testing practices vary. Some states require all children by tested while other states target high-risk children
- A birth cohort consists of all children born in a given year. This data shows the number and percent of children in a birth cohort who were tested for the presence of blood lead before 3 years of age
- Some counties are reported as having more than 100% of children tested. Percentages were calculated using the the number of children tested within a birth cohort year. This number doesn't account for children who move into the county before being tested, or when the provider's address is used in place of the child's residence.

Data Notes:

- Data provided by CDC Lead Poisoning Prevention Program and state and local Childhood Lead Poisoning Prevention Programs. Compiled by the Department of Health and Senior Services' Bureau of Environmental Epidemiology
- Measures should not be compared across states. Childhood blood lead testing practices vary. Some states require all children by tested while other states target high-risk children
- A birth cohort consists of all children born in a given year. This data shows the number and percent of children in a birth cohort who were tested for the presence of blood lead before 3 years of age
- Some counties are reported as having more than 100% of children tested. Percentages were calculated using the the number of children tested within a birth cohort year. This number doesn't account for children who move into the county before being tested, or when the provider's address is used in place of the child's residence.
